

Brief for Wix plugin

1. Plugin is simply a form creator that functions with images.
2. Once the form options are changed, image should be changed dynamically with suitable effect (Can be cross faded).
3. Every option should include price information, which will be calculated in the end.
4. Option bar, linked images and buttons needs to be moved within the page independently.
5. Option bar needs to have hide/show options button.
6. Some options may not include images. They will only appear as texts.
7. Sometimes some options should have the ability to lock other option(s). (For example, once the living room floors are selected, kitchen floors should be the same as living room, we cannot do different floors for both kitchen and living room) (We are also open to alternative solutions to solve this issue)
8. Plugin should work versatile between mobile and desktop interfaces.
9. Contact details needs to be a part of the form.
10. We will have a base image, then the transparent assets for different materials will overlap on base image.
11. It would be great if plugin would work with Editor X
12. Simplicity is our focus and we are open to any suggestions.
